Due Diligence

Prepared for Commonwealth Building, Inc.

This document supports the POC Proposal. Section 1 confirms what systems and licenses are in place today, so nothing is proposed that you already own. The remaining sections cover the potential follow-on projects; each states the intended deliverable and the questions that must be answered before it can be scoped.

1. Current systems and licensing

Procore

- You use Procore for document control, change orders, invoicing, field documentation, and commitments. Beyond those, which products are included in your subscription: Bidding, Estimating, Analytics, ERP Integrations?
- Are Procore's AI agents included? If so, which package: Starter, Pro, or Enterprise?
- Who administers your Procore account? Scoping several of the projects below requires working access.

Buildr

- Which Buildr modules are licensed (CRM, Estimating, Bidding, Forecasting, Workforce Planning), and which are in active use?
- Is Kit included? Is the Handover product included?

Sage

- You mentioned Sage 300. Confirming: is it Sage 300 CRE (formerly Timberline), and is it on-premise or hosted? Procore's built-in connector is specific to Sage 300 CRE, so this determines the integration path.
- Is the Procore-Sage connector installed and running today, or does data move between the systems another way?

Microsoft

- Which Microsoft 365 plan are your users on?
- Is your Copilot the free Copilot Chat included with Microsoft 365, or paid Microsoft 365 Copilot licenses? Building the assistant in Copilot, grounded on your documents, requires a paid license per user, so this factors into the platform decision and its cost.

2. Automated Procore reporting

Deliverable: the reports your team currently builds in Excel, produced automatically from Procore exports in your existing formats. The build depends on where each number originates and what transformations happen in Excel today.

- Please provide two or three current report examples together with the Procore exports they were built from. The differences between the two define the automation.
- For each report, which figures come straight from Procore, which come from Sage, and which are adjusted or entered by hand?
- What triggers each report: monthly close, a draw, an owner request? Who receives it, and in what form (Excel, PDF, printed)?

3. Procore-to-Buildr transfer tool

Deliverable: the data you currently move by hand delivered into Buildr without the export, reformat, and import routine. Buildr's estimating is built on historical cost data, and that history originates in Procore and Sage, which is likely what this transfer feeds; confirming the purpose of the transfer determines the design.

- What data is transferred, and what is it used for in Buildr? Is it historical cost data feeding estimates, or something else?
- What does the reformatting step actually change: column names, cost code structure, units, formatting? A before-and-after file pair would define the transformation rules exactly.
- How does the data get into Buildr today: a CSV import screen, manual entry, or something else? What import options does your Buildr account show?
- How often does this happen, and how long does each cycle take?
- With your approval, FutureInSites will contact Buildr regarding API access.

4. Procore-Sage 300 integration

Deliverable: budgets, commitments, invoices, and job costs synchronized between Procore and Sage, with no rekeying between project management and accounting. The design depends on whether the built-in connector applies, and on how closely the two systems' cost structures align; mapping cost codes is typically the largest part of this work.

- What is entered into both systems today, and by whom? For example: subcontractor invoices, commitments, change orders, budget updates.
- Do Procore cost codes and the Sage job cost structure match, or are they maintained separately?

FutureInSites

AI Strategy & Engineering

- Roughly how many invoices and commitments move through per month? Volume determines whether this pays for itself.

5. Automated client progress update

Deliverable: the owner-facing progress update generated from project data on a set schedule, ready for review before sending. The sources would be data already in your systems: daily logs, photos, schedule, and budget status.

- Is a regular update sent to clients today? May I see a recent example?
- Which parts of it come from Procore, which from the schedule, and which are written fresh each time?
- Who assembles it, how long does it take, and who reviews it before it goes out?

6. Subcontractor bid intake tool

Deliverable: emailed PDF bids entered into Procore bid forms automatically. Procore's bid comparison requires values entered in its bid forms and does not extract data from PDFs; it also requires bid packages configured with response types. Whether this tool is worth building depends on volume and on how your subcontractors actually submit.

- What share of subcontractor bids arrive as emailed PDFs versus entered through Procore?
- Are bid packages with structured bid forms in use today?
- How many bid packages does a typical month involve, and how many bids per package?
- Who levels bids today, and how much time does carrying scope across formats take?

7. POC planning

- Where do SOP and workflow documents live today: SharePoint, a file share, Teams, or in print?
- What formats are they in (Word, PDF, scanned paper), and roughly how many documents are there? Scanned documents require an extra processing step.
- Who owns those documents, and who confirms which version is current?
- Are any of them confidential beyond normal company access, requiring restricted permissions in the assistant?
- Approximately how many people would receive AI access?

8. Open items from the kickoff meeting

FutureInSites

AI Strategy & Engineering

- Regarding the idea of extending Kit into an additional agent: what workflow is intended, and what would it need to produce?
- How are staffing decisions made between larger crews for shorter durations and smaller crews for longer durations?
- How does union versus open-shop labor factor into work pursued in new geographies?
